1D Convolution

- (actually cross-correlation)

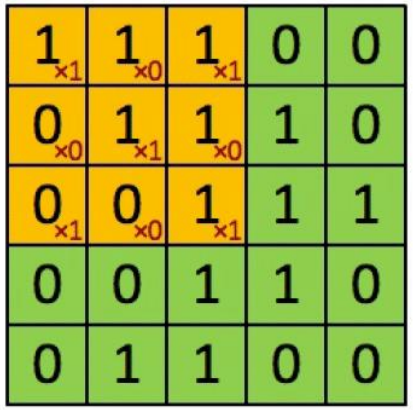
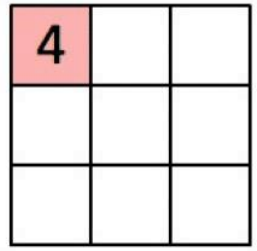
2D Convolution

Convolution on Image (= Convolution in 2D)

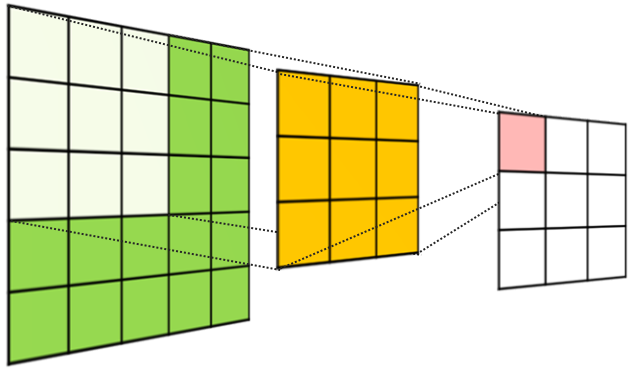
- Filter (or Kernel)
  - Discrete convolution can be viewed as **element-wise multiplication** by a matrix
  - Modify or enhance an image by filtering
  - Filter images to emphasize certain features or remove other features
  - Filtering includes smoothing, sharpening and edge enhancement



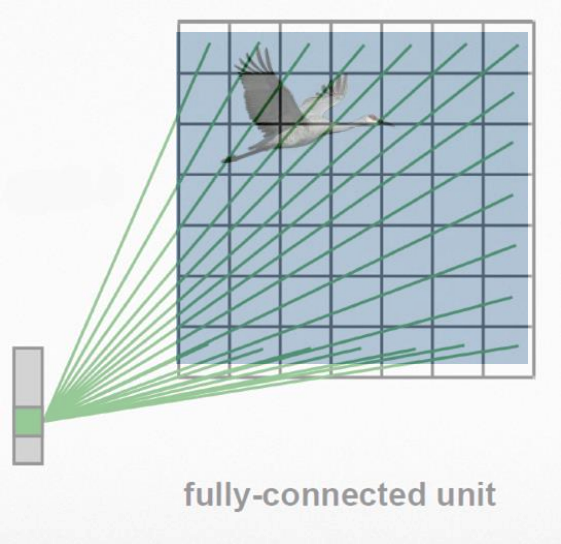
Image



Convolved Feature

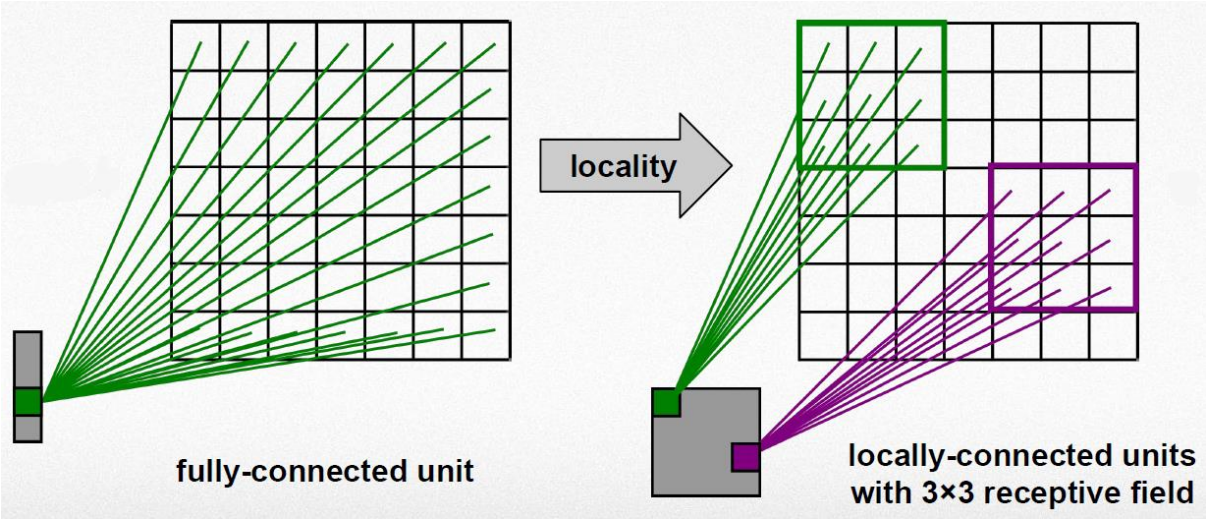


Convolution Mask + Neural Network



Locality

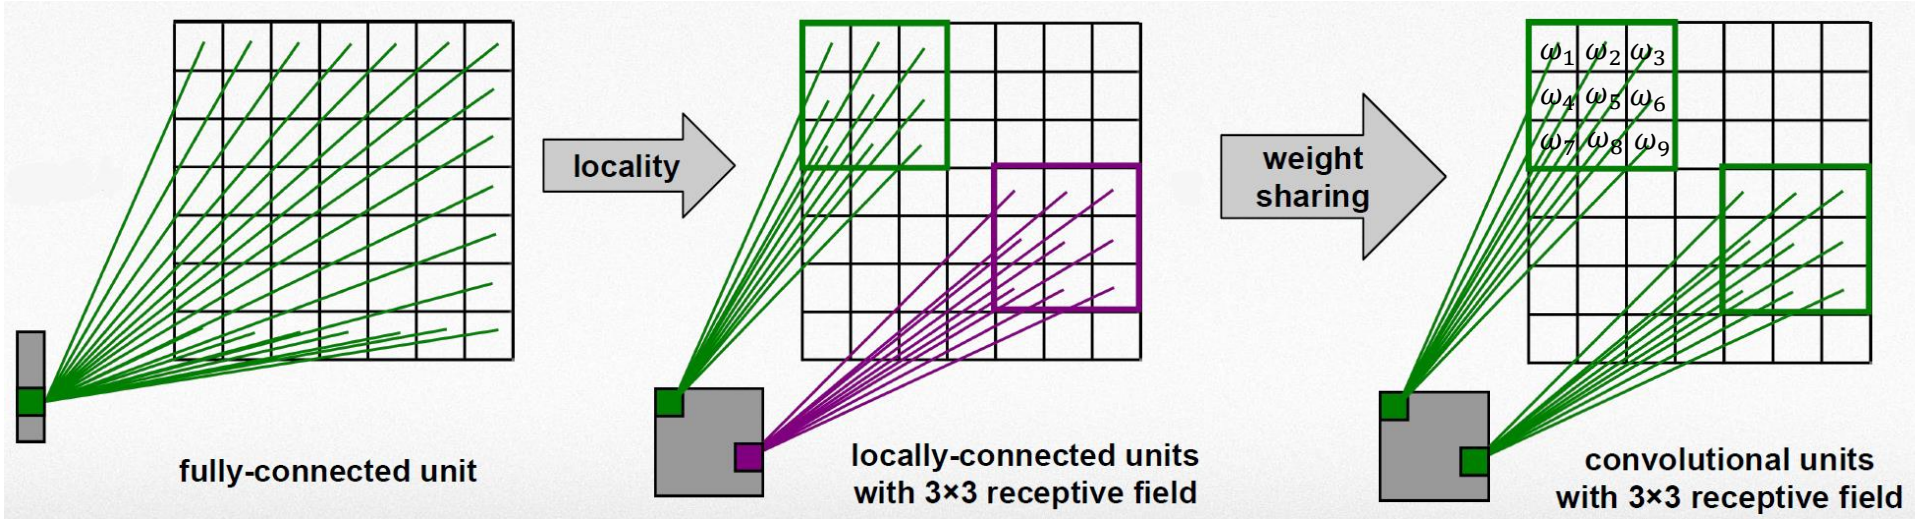
- Locality: objects tend to have a local spatial support
  - fully-connected layer → locally-connected layer



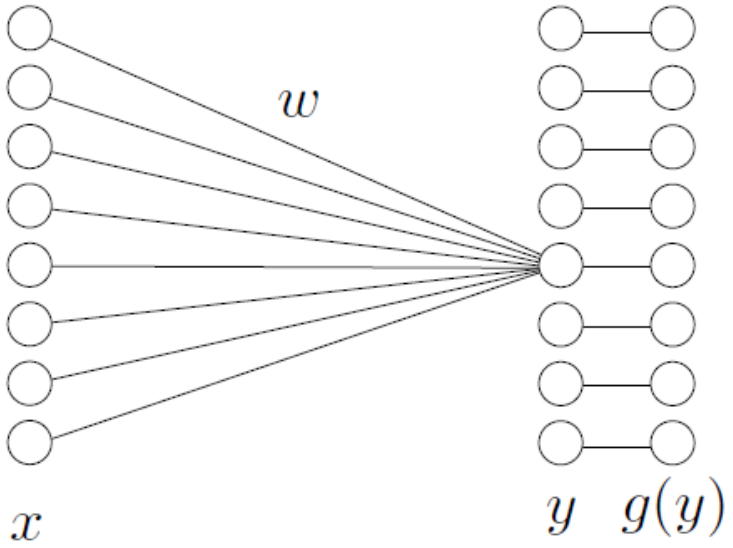
Locality

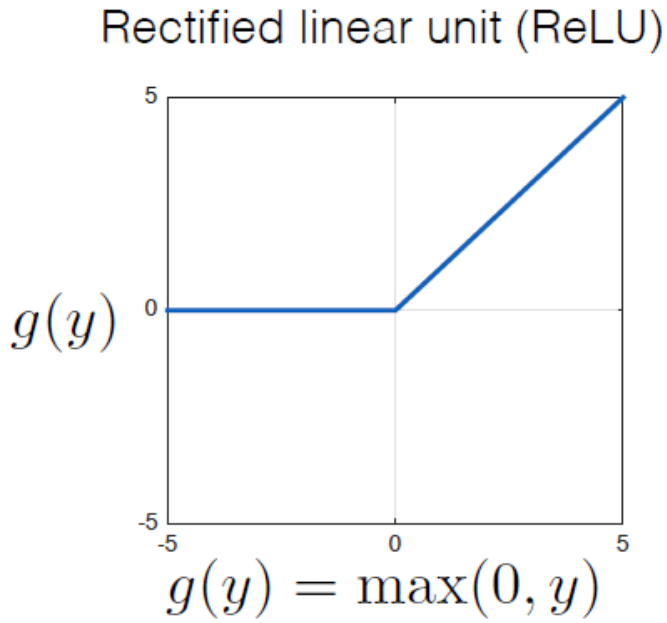
- Locality: objects tend to have a local spatial support
  - fully-connected layer → locally-connected layer

We are not designing the kernel, but are learning the kernel from data
→ Learning feature extractor from data



Nonlinear Activation Function

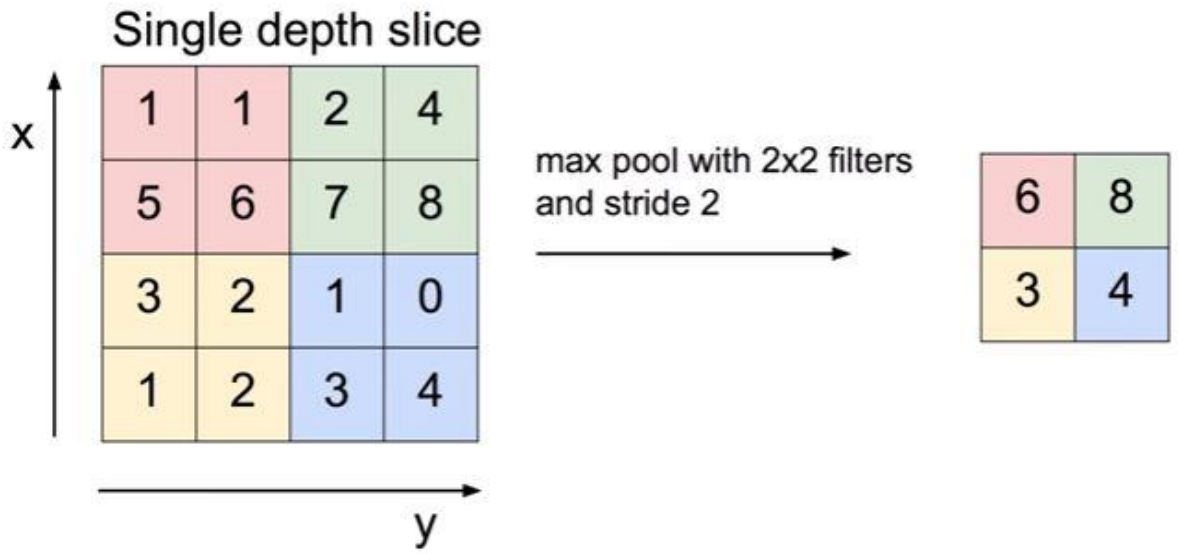




Pooling

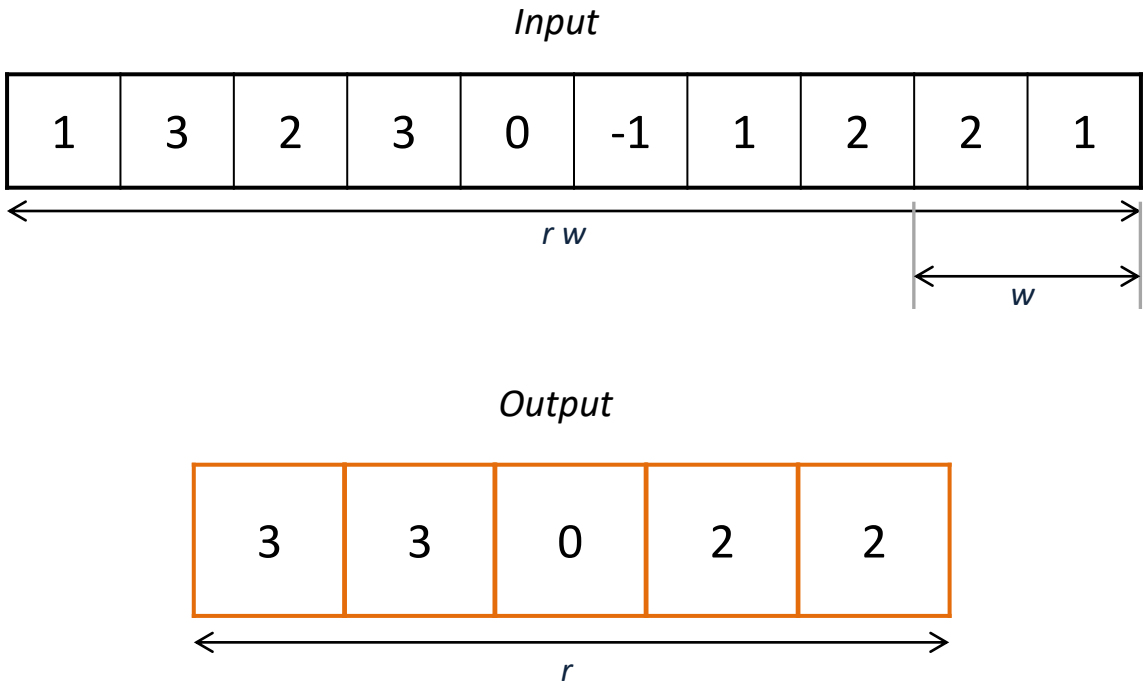
Pooling

- Compute a maximum value in a sliding window (max pooling)
- Reduce spatial resolution for faster computation
- Achieve invariance to local translation
- Max pooling introduces invariances
  - Pooling size : 2×2
  - No parameters: max or average of 2x2 units



Pooling

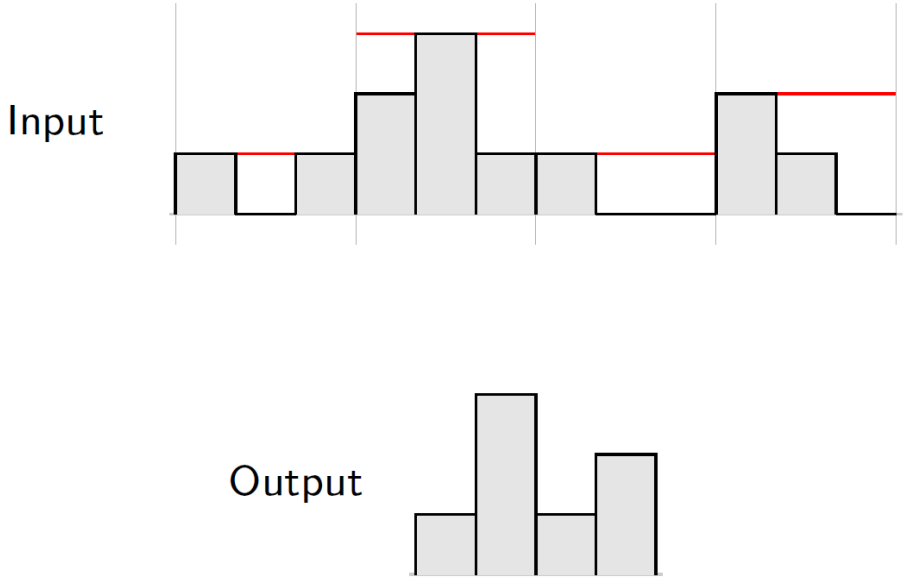
- Such an operation aims at grouping several activations into a single “more meaningful” one.



- The average pooling computes average values per block instead of max values

Pooling: Invariance

- Pooling provides invariance to any permutation inside one of the cell
- More practically, it provides a pseudo-invariance to deformations that result into local translations



Source: Dr. Francois Fleuret at EPFL

Pooling: Invariance

- Pooling provides invariance to any permutation inside one of the cell
- More practically, it provides a pseudo-invariance to deformations that result into local translations

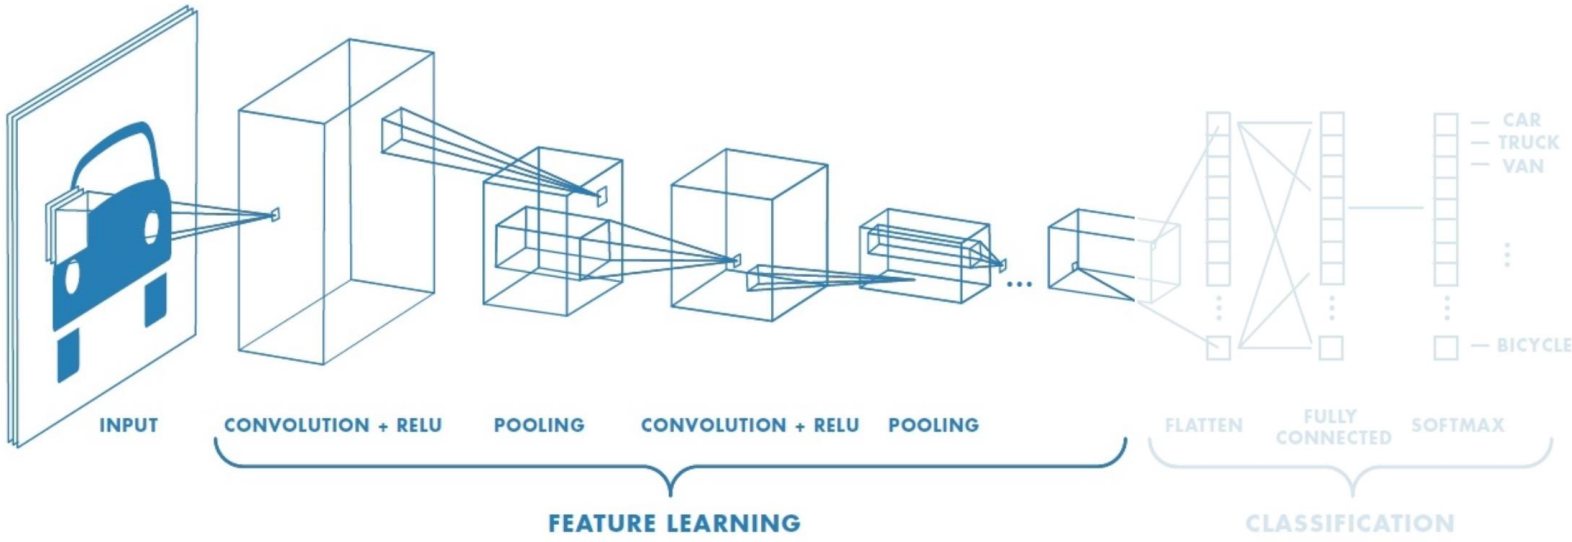
CNNs for Classification: Feature Learning

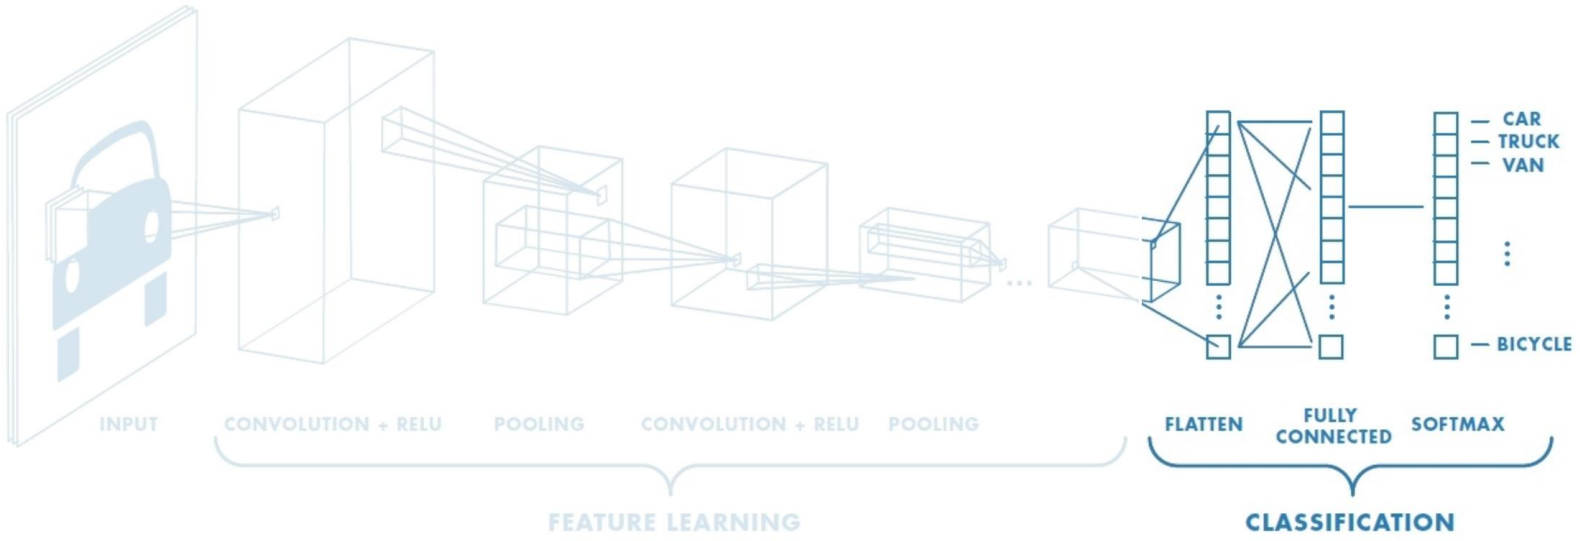
- Learn features in input image through convolution
- Introduce non-linearity through activation function (real-world data is non-linear!)
- Reduce dimensionality and preserve spatial invariance with pooling



Source: 6.S191 Intro. to Deep Learning at MIT

CNNs for Classification: Class Probabilities

- CONV and POOL layers output high-level features of input
- Fully connected layer uses these features for classifying input image
- Express output as probability of image belonging to a particular class



$$\text{softmax}(y_i) = \frac{e^{y_i}}{\sum_j e^{y_j}}$$

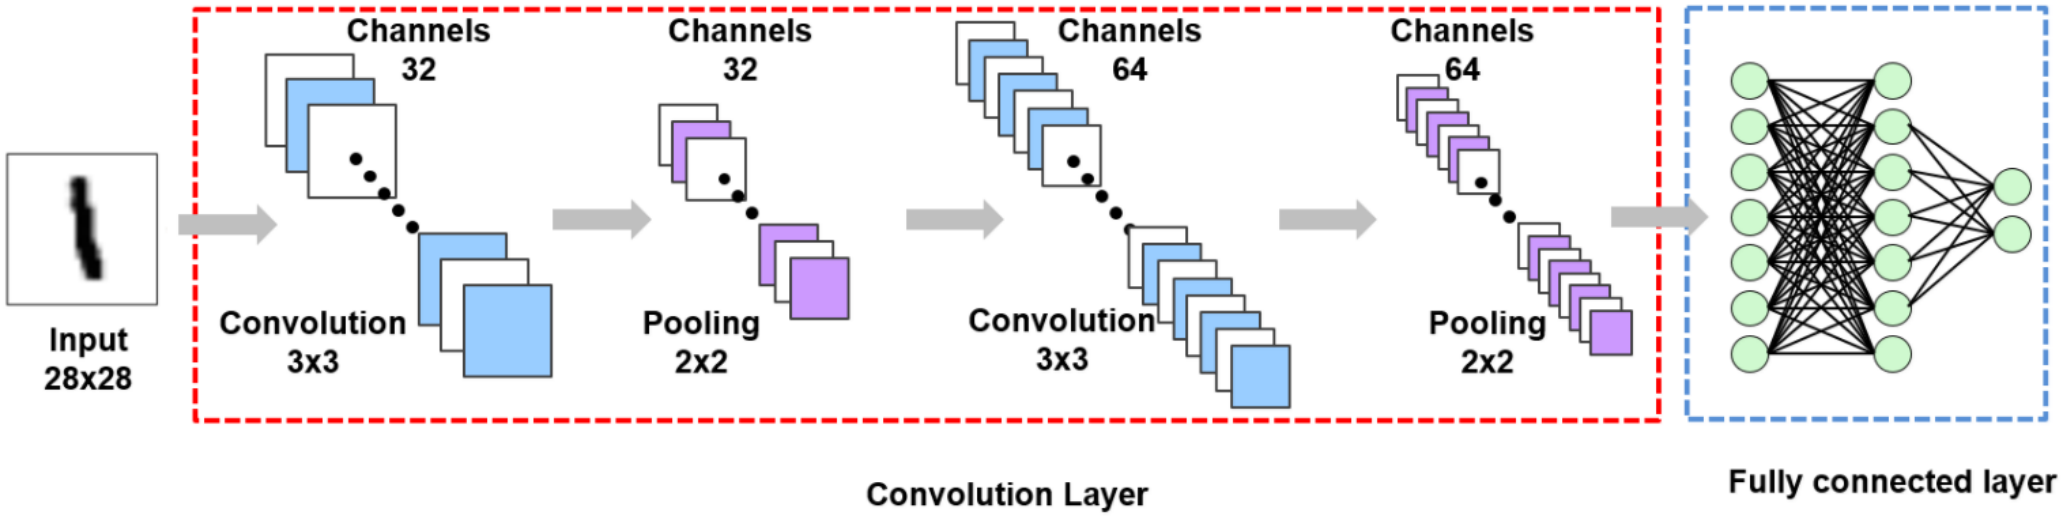
CNN in TensorFlow

Lab: CNN with TensorFlow

- MNIST example
- To classify handwritten digits



CNN Structure

```
model = tf.keras.models.Sequential([
    tf.keras.layers.Conv2D(32,
                           (3,3),
                           activation = 'relu',
                           padding = 'SAME',
                           input_shape = (28, 28, 1)),

    tf.keras.layers.MaxPool2D((2,2)),

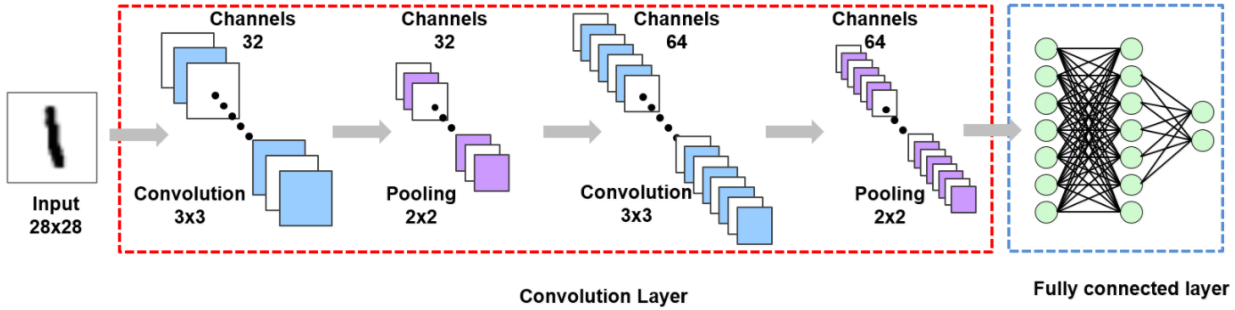
    tf.keras.layers.Conv2D(64,
                           (3,3),
                           activation = 'relu',
                           padding = 'SAME',
                           input_shape = (14, 14, 32)),

    tf.keras.layers.MaxPool2D((2,2)),

    tf.keras.layers.Flatten(),

    tf.keras.layers.Dense(128, activation = 'relu'),

    tf.keras.layers.Dense(10, activation = 'softmax')
])
```



Loss and Optimizer

- Loss
  - Classification: Cross entropy
  - Equivalent to applying logistic regression
- Optimizer
  - GradientDescentOptimizer
  - AdamOptimizer: the most popular optimizer

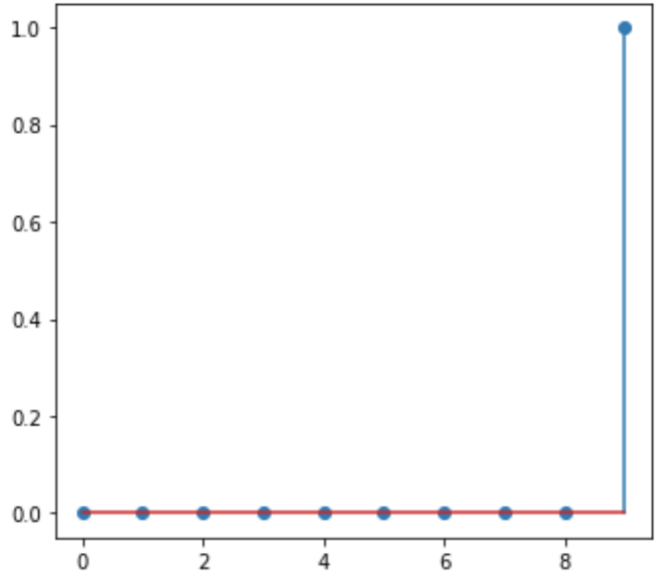
```
model.compile(optimizer = 'adam',
              loss = 'sparse_categorical_crossentropy',
              metrics = ['accuracy'])
```

```
model.fit(train_x, train_y)
```

Test or Evaluation

```
test_loss, test_acc = model.evaluate(test_x, test_y)
```

```
313/313 [==============================] - 1s 4ms/step - accuracy: 0.9838 - loss: 0.0466
loss = 0.05, Accuracy = 98 %
```



```
Prediction : 9
```
