

# **(Artificial) Neural Networks: From Perceptron to MLP**

**Industrial AI Lab.  
Prof. Seungchul Lee**

# Perceptron: Example

$$\begin{aligned}\hat{y} &= g(\omega_0 + X^T \omega) \\ &= g\left(1 + \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}^T \begin{bmatrix} 3 \\ -2 \end{bmatrix}\right) \\ &= g(1 + 3x_1 - 2x_2)\end{aligned}$$

# Perceptron: Example

$$\hat{y} = g(1 + 3x_1 - 2x_2)$$

# Perceptron: Example

$$\hat{y} = g(1 + 3 \times (-1) - 2 \times 2) = g(-6) = -1$$

$$\hat{y} = g(1 + 3x_1 - 2x_2)$$

# Perceptron: Forward Propagation

$$\hat{y} = g(\omega_0 + X^T \omega)$$

$$= g\left(\omega_0 + \begin{bmatrix} x_1 \\ \vdots \\ x_m \end{bmatrix}^T \begin{bmatrix} \omega_1 \\ \vdots \\ \omega_m \end{bmatrix}\right)$$

# From Perceptron to MLP

# XOR Problem

- Minsky-Papert Controversy on XOR
  - Not linearly separable
  - Limitation of perceptron

$x_1$	$x_2$	$x_1 \text{ XOR } x_2$
0	0	0
0	1	1
1	0	1
1	1	0

- Single neuron = **one linear classification boundary**

# Artificial Neural Networks: MLP

- Multi-layer Perceptron (MLP) = Artificial Neural Networks (ANN)
  - Multi neurons = multiple linear classification boundaries

# Artificial Neural Networks: Activation Function

- Differentiable nonlinear activation function

# Artificial Neural Networks

- In a compact representation

# Artificial Neural Networks

- A single layer is not enough to be able to represent complex relationship between input and output  
⇒ perceptron with many layers and units

- Multi-layer perceptron
  - Features of features
  - Mapping of mappings

# Another Perspective: ANN as Kernel Learning

# Neuron

- We can represent this “neuron” as follows:

$$f(x) = \sigma(w \cdot x + b)$$

# XOR Problem

- The main weakness of linear predictors is their lack of capacity.
- For classification, the populations have to be linearly separable.

“xor”

# Nonlinear Mapping

- The XOR example can be solved by pre-processing the data to make the two populations linearly separable.

# Nonlinear Mapping

- The XOR example can be solved by pre-processing the data to make the two populations linearly separable.

$$\phi : (x_u, x_v) \rightarrow (x_u, x_v, x_u x_v)$$

# Nonlinear Mapping

- The XOR example can be solved by pre-processing the data to make the two populations linearly separable.

$$\phi : (x_u, x_v) \rightarrow (x_u, x_v, x_u x_v)$$

# Kernel

- Often we want to capture nonlinear patterns in the data
  - nonlinear regression: input and output relationship may not be linear
  - nonlinear classification: classes may not be separable by a linear boundary
- Linear models (e.g. linear regression, linear SVM) are not just rich enough
  - by mapping data to higher dimensions where it exhibits linear patterns
  - apply the linear model in the new input feature space
  - mapping = changing the feature representation
- Kernels: make linear model work in nonlinear settings

# Kernel + Neuron

- Nonlinear mapping + neuron

$$\phi : (x_u, x_v) \rightarrow (x_u, x_v, x_u x_v)$$

# Neuron + Neuron

- Nonlinear mapping can be represented by another neurons

- Nonlinear Kernel
  - Nonlinear activation functions

# Multi Layer Perceptron

- Nonlinear mapping can be represented by another neurons
- We can generalize an MLP

# Summary

- Universal function approximator
- Universal function classifier
- Parameterized

# Artificial Neural Networks

- Complex/Nonlinear universal function approximator
  - Linearly connected networks
  - Simple nonlinear neurons

# Deep Artificial Neural Networks

- Complex/Nonlinear universal function approximator
  - Linearly connected networks
  - Simple nonlinear neurons

# Looking at Parameters

# Logistic Regression in a Form of Neural Network

$$y = \sigma(\omega_0 + \omega_1 x_1 + \omega_2 x_2)$$

# Logistic Regression in a Form of Neural Network

- Neural network convention

$$y = \sigma(\omega_0 + \omega_1 x_1 + \omega_2 x_2)$$

$\omega_0 \rightarrow b$

$$y = \sigma(b + \omega_1 x_1 + \omega_2 x_2)$$

Do not indicate bias units

```
n_input = 2  
n_output = 1
```

# Nonlinearly Distributed Data

- Example to understand network's behavior
  - Include a hidden layer

Do not include bias units

```
n_input = 2  
n_hidden = 2  
n_output = 2
```

# Multi Layers

- z space

Do not include bias units

n\_input = 2  
n\_hidden = 2  
n\_output = 2

# Multi Layers

- $x$  space

Do not include bias units

```
n_input = 2  
n_hidden = 2  
n_output = 2
```

# **(Artificial) Neural Networks: Training**

**Industrial AI**  
**Prof. Seungchul Lee**

# Training Neural Networks: Loss Function

- Measures error between target values and predictions

$$\min_{\omega} \sum_{i=1}^m \ell \left( h_{\omega} \left( x^{(i)} \right), y^{(i)} \right)$$

- Example

- Squared loss (for regression):

$$\frac{1}{m} \sum_{i=1}^m \left( h_{\omega} \left( x^{(i)} \right) - y^{(i)} \right)^2$$

- Cross entropy (for classification):

$$-\frac{1}{m} \sum_{i=1}^m y^{(i)} \log \left( h_{\omega} \left( x^{(i)} \right) \right) + \left( 1 - y^{(i)} \right) \log \left( 1 - h_{\omega} \left( x^{(i)} \right) \right)$$

# Gradients in ANN

- Learning weights and biases from data using gradient descent
- $\frac{\partial \ell}{\partial \omega}$ : too many computations are required for all  $\omega$
- Structural constraint of NN:
  - Composition of functions
  - Chain rule
  - Dynamic programming

# Training Neural Networks with TensorFlow

- Optimization procedure

- It is not easy to numerically compute gradients in network in general.
  - The good news: people have already done all the "hard work" of developing numerical solvers (or libraries)
  - There are a wide range of tools → We will use the TensorFlow

# ANN in TensorFlow: MNIST
